# Collab™ Conference Tables for Active Learning Studio Spaces

The key for Active Learning Collaboration is Universal Design, which allows flexible scheduling of small groups to form for the activities of learning.

The entire Collaboration Space allows students to freely interact student-to-student, student-to-teacher, student-to-computer, and teacher-to-class. Active Learning Studio Spaces must support all channels of communication simultaneously so activities of learning can be changed at will.

Collab's equilateral shape was selected as the ideal for the group activities planned, but the cable management and connectivity to laptops and AV controls and sound reinforcement drove innovation.

## flipIT® Laptop Safe

Metal parts of the flipIT® Laptop Safe have been custom powdercoated silver to match the leg and center column base treatment. This view shows how the wire management pass-through serves the university laptop with a locked tether cable and VGA connection. These connections remain when the unit is closed and locked.

## The Concept™

Pop-up power & data module, configured with six RJ45 and four 110VAC outlets, is installed in the center of the table to serve personal laptops. The top is pressed to open and close.

## Space and Product Designed Together

The product design was approached concurrently with the floor plan and space plan to determine angles of view for large hi-def displays and all possible seating arrangements. Then locations for power and data could be determined in the floor. These would be totally captured by the robust Collab™ Table Bases, which were designed specifically for this Learning Center installation.

### The 8x20 inch access hatch

permits easy IT access. Power and data is supplied from the floor, totally captured by the Collab™ Table base. The housing for the Concept™ can be seen in the open hatch. The base conceals all unsightly cables, but provides easy access.
